News Desk

Amstrad machine is announced

ALAN Sugar, Amstrad's chairman, has now formally announced the Amstrad home computer.

Called the CPC 464, the machine will be offered in four versions. System 1 consists of the CPC 464 console with green screen monitor, priced at £229. System 2 replaces the green screen monitor with a colour monitor for £329. Systems 3 and 4 are the same as 1 and 2, respectively, except a single 3in Hitachi disc drive is also included running CPM. These latter options are priced at £429 and £529.

The two disc versions result from a licensing deal with Digital Research for the CPM 2.2 disc operating system.

Amstrad plans to deliver the first batch of 1,000 machines to stores in June and by Christmas expects to have produced over 200,000 machines, all of which have already been underwritten by the major chain stores.

The CPC 464 is to be sold initially by Boots, Dixons, Comet (recently bought by Woolworths) and Rumbelows.

The CPC 464 — reviewed in this issue — has a Z80 processor, with 64K Ram and 32K

Rom. The machine also features a built-in cassette unit.

According to Alan Sugar, the machines demonstrated at the launch were production run units with finished Roms, which means that Amstrad may well avoid embarrassing delivery delays.

Software for the CPC 464 also looks healthy. By June continued on page 5 ▶

Tatung launches micro

TAIWANESE electronics giant, Tatung, this week launches its first home computer — developed and manufactured in the UK.

The machine is Z80A based with a professional quality keyboard, 64K Ram and has a single 3in Hitachi disc drive built in.

The machine runs a version of Basic similar to Microsoft

Basic and its disc operating system is similar to Digital Research's CPM. According to a company spokesman the machine will be able to run programs written for CPM.

Screen display is both 40 and 80 columns and it has a graphics mode of 256 x 192 pixels.

The machine has both RS232 and Centronics printer interfaces.

EMPIRES

**When a Galactic war breaks out,
there is only one winner –
make sure it's you!**

Empires is a game of the type which has not been seen before. It is a fully player interactive strategy game for up to six players and an umpire. The basic set contains three players. Expansion set one contains three more. Each player controls a unique race struggling to take over the galaxy. Mining companies, space fleets and sound strategy all contribute to the success of your race; but beware the other players will be trying to tear your empire apart. The skill required to organise your empire as it grows is enormous. To assist you galactic maps and data cards are provided. Soon further expansion sets will be available to give you an advantage over the other players. Move information is transferred via cassette to the umpire who analyses it with his program and returns the new data to the players. Messages can be sent to other players in the same way.

**THIS IS A NEW CONCEPT IN STRATEGY
GAME PLAYING.**

48K SPECTRUM

CONTENTS: THREE PLAYER CASSETTES, ONE UMPIRE CASSETTE,
4 GALACTIC MAPS, 81 DATA CARDS, 1 FULL SET OF RULES, 3 PLAYER INSTRUCTIONS

Price £19.95.

How to submit articles

Articles which are submitted for publication should not be more than 3,000 words long. The articles, and any accompanying programs, should be original. It is breaking the law of copyright to copy programs out of other magazines and submit them here — so please do not be tempted.

Accuracy

Popular Computing Weekly cannot accept any responsibility for any errors in programs we publish, although we will always try our best to make sure programs work.

Editorial

The launch of the Amstrad CPC 464 and the imminent arrival of the MSX machines could change the face of the UK micro market.

The Amstrad machine is based upon an elder statesman among microprocessors — the Z80 chip. However, it comes complete with its own monitor, built-in cassette recorder, 64K Ram and 32K Rom, all for just £229. In addition, software support is promised in the form of 50 programs when the CPC 464 hits the shops in June.

With large chain stores such as Comet, Boots and Rumbelows already agreeing to take the Amstrad in quantity, it looks set to make quite an impact on the market — though it is does depend on the machine being readily available, in quantity, on time.

This will undoubtedly affect those companies which are already losing their share of the home market, notably Computers and Dragon. It could also conceivably hit Sinclair's still invisible QL, particularly as an Amstrad disc drive should also make its debut soon.

With the marketing muscles of the MSX companies added to the fray, Commodore, Sinclair and Acorn will suddenly find themselves faced with their first real outside competition.

Christmas 1984 is likely to be an even bigger micro buying spree than Christmas 1983. It is also starting to look as if there will be a much wider choice of machines.

Next Thursday

Next week's star game is Ye Olde Castle for BBC B by Simon Pitners, in which you must rescue the princess from the castle.

ADVENTURE REVIEWS

"Adventures which have a fast response time, are spectacular in the amount of detail and number of locations, and are available to cassette owners... Simply smashing!"

— Soft, Sept 83

"Colossal Adventure is included in Practical Computing's top ten games choice for 1983: 'Poetic, moving and tough as hell.'"

— PC, Dec 83

"Colossal Adventure... For once here's a program that lives up to its name... a masterful feat. Thoroughly recommended"

— Computer Choice, Dec 83

"Colossal Adventure is one of the best in its class. I would recommend it to any adventurer."

— Acorn User, Feb 84

"Adventure Quest... This has always been one of the best adventures for me as it seems to contain the lot. In all it took me about eight months to solve."

— PCW, 18th Jan 84

"To sum up, Adventure Quest is a wonderful program, fast, exciting and challenging. If you like adventures then this one is for you"

— NILUG issue 3.3

"Colossal Adventure is simply superb... For those who want to move onto another adventure of similar high quality, Dungeon Adventure is recommended. With more than 200 locations, 700 messages and 100 objects it will tease and delight!"

— Educational Computing, Nov 83

ADVENTURE REVIEWS

"Colossal Adventure... undoubtedly the best Adventure game around. Level 9 Computing have worked wonders to cram all this into 32K... Finally Dungeon Adventure, last but by no means least. This is the best of the lot — a truly massive adventure — you'll have to play it yourselves to believe it."

— CBM 64 Users Club Newsletter

"The puzzles are logical and the program is enthralling. Snowball is well worth the money which, for a computer program, is a high recommendation."

— Micro Adventurer, Dec 83

"Snowball... As in all Level 9's adventures, the real pleasure comes not from scoring points but in exploring the world in which the game is set and learning about its denizens... this program goes to prove that the mental pictures conjured up by a good textual adventure can be far more vivid than the graphics available on home computers."

— Which Micro?, Feb 84

"Lords of Time. This program, written by newcomer Sue Gazzard, joins my favourite series and is an extremely good addition to Level 9's consistently good catalogue... As we have come to expect from Level 9, the program is executed with wonderful style — none of those boring 'You can't do that' messages! Highly recommended."

— PCW, 1st Feb 84

MIDDLE EARTH ADVENTURES

1: COLOSSAL ADVENTURE

A complete, full size version of the classic mainframe game "Adventure" with 70 bonus locations added.

2: ADVENTURE QUEST

Centuries have passed since the time of Colossal Adventure and evil armies have invaded The Land. The way is long and dangerous; but with cunning you can overcome all obstacles on the way to the Black Tower, source of their demonic power, and destroy it.

3: DUNGEON ADVENTURE

The trilogy is completed by this superb adventure, set in the Dungeons beneath the shattered Black Tower. A sense of humour is essential!

THE FIRST SILICON DREAM ADVENTURE

1: SNOWBALL

The first of Pete Austin's second trilogy. The giant colony starship, Snowball 9, has been sabotaged and is heading for the sun in this massive game with 7000 locations.

THE LORDS OF TIME SAGA

7: LORDS OF TIME

Our congratulations to Sue Gazzard for her super design for this new time travel adventure through the ages of world history. Chill to the Ice-age, go romin' with Caesar's legions, shed light on the Dark Ages, etc.

Price: £9.90 each (inclusive)

Level 9 adventures are available from good computer shops, or mail-order from us at no extra charge. Please send order, or SAE for catalogue, to:

Please describe your computer

Library access for micro owners

SPECTRUM, Commodore 64 and Oric owners are soon to have access to the library of software — now extending to over 5,000 titles — available under the CP/M operating system.

ITL Kathmill, maker of the Byte Drive 500 disc unit for the Oric, has concluded a deal with CP/M's owners, Digital Research, to implement the operating system on its disc configuration.

The company will shortly announce its CP/M disc system for the 48K Spectrum. For around £150 the company will offer a disc interface unit which plugs into the expansion con-

necter on the Spectrum. The unit will provide 16K Ram (bringing the Spectrum's memory up to the 64K level required by CP/M), an RS232 port, a Centronics printer interface, a disc connector, a continuation of the Spectrum's own expansion bus and a floppy disc containing the CP/M 2.2 disc operating system software.

Up to four disc drives can then be plugged into the interface — even of a variety of types: 3inch, 3½inch and 5¼.

ITL will also be selling its own 3inch drives, compatible with the system at £192. These are double-sided double-density drives with a formatted capacity of 220K per side.

The interface unit for the Spectrum is expected to be ready in May. The disc drives are available now.

Both the Oric and Commodore 64 versions of the system are not expected to be ready until September. Neither machine is Z80-based, so the interface units will include a Z80 chip as a second processor together with 64K Ram. In the case of the Oric 1 and Atmos version, the unit will also feature a built-in modem.

For the Spectrum, the company will also offer a non-CP/M version of the disc system without the CP/M operating system disc and without the extra 16K Ram. This is expected to sell for around £100.

Amstrad

◀ continued from page 1

some 50 cassette titles will be finished. About 22 titles are running now.

These will include educational titles from Bourne Software, a wordprocessor from Juniper, Pascal from Hisoft and a promising selection of games conversions. These include: *Codename Mat* and *Haunted Hedges* from Micromega, two titles from Indescomp *Roland in the Cave* and *Roland on the Ropes* (better known in this country as Quicksilver's *Boogaboo* and *Fred*), *Mr Wimpey*, *Hunchback* and *Pengwyn* from Ocean, *Microbot* from Softek and several titles from Romik.

An assembler/disassembler is in the pipeline and Softek is working on a Basic Compiler.

The CPC 464 is to be launched simultaneously in the UK, France and Germany. At present there are no plans to sell the Korean manufactured micro in the US.

Tatung micro

◀ continued from page 1

Taiwan's largest company — took over Decca's consumer electronics division three years ago and the new micro will be manufactured at its plant in Bridgnorth, Shropshire.

The machine is expected to be priced at the upper end of the home micro price range.

ASA takes notice

THREE months after Sinclair first began taking orders for non-appearing QL computers, the Advertising Standards Authority has begun to take notice.

Following complaints from customers still waiting for their machines the ASA, according to its spokesman, is now "pursuing an investigation against Sinclair".

Although the ASA has no legal weight it can bring to bear on the problem, it can advise publishers to refuse to carry advertisements placed by Sinclair.

● PCW's QL order. Week 13.

Epson launches new printers

EPSON has launched four new printers.

The P40 thermal printer is

priced at £110. A compact dot-matrix machine, it prints at 45 characters per second with 40 characters a line. Varying the character mode will produce either 80 or 20 characters to a line.

Rather more expensive is the Epson P80 thermal transfer

Hopes raised last week now appear premature. If we are lucky one of us will spend six hours with one of the beasts some time this week — supervised by a Sinclair employee. This is volume production?

Valhalla converts to CBM 64

THE award winning adventure game *Valhalla* is being converted to run on the Commodore 64. The game itself will be identical to the Spectrum version, but Legend are concentrating on improving the graphics for the 64.

Priced at £14.95, it should be available from the beginning of May.

Oric completes its shake-up

ORIC has now completed an internal reorganisation, begun after its takeover last November by Edenspring Investments.

John Tullis

John Tullis has stepped down as chairman, with his place being taken by the present Edenspring chairman, David Duguid. John Tullis leaves to devote time to his other business interests, although he will still act as a consultant to Oric.

Barry Muncester remains as managing director, a post he now holds jointly with Edenspring's managing director, Peter Jones. Barry also becomes a joint managing director of Edenspring.

Rental plans for Falconhurst

VIDEO hire specialist Falconhurst plans to begin renting out computer games for the Spectrum and Commodore 64.

The company has 150 video outlets throughout the country — mainly inside independent grocery stores. The titles will be hired out by a related company, Falconsoft, for as little as 50p per night or £2 for a week.

Falconsoft spokesman John Le Mesurier said: "The reaction from software houses has generally been hostile, but there is nothing they can do about it."

"Computer games are just not worth the £6 or so they are charging for them."

Public-key ciphers

Regarding your correspondent who does not believe in the efficacy of public-key ciphers, he can, of course believe whatever he wants to, but the fact remains that they work and are relied upon by a great number of people.

Yes, we all know how good one-time-pad is, but there is still the problem of secure communication of the pads in the first place.

If he wants to generate true random numbers I would suggest that he thinks in terms of using the vast number of natural noises in the environment, in such a way that they interact with each other. I have a system which uses a combination of a microphone attached to the bottom of a bird cage, another attached to the aquarium, one placed where it picks up wind noise, and a temperature sensor in a very draughty situation.

As far as encryption of data over BT circuits is concerned, I can assure you all that it is not only allowed, but encouraged by BT (for further information see the PSS technical guide). Also, when using a modem to communicate with another one via the PSTN, there is no requirement to use any particular baud rate, as long as you don't try to exceed the maximum, which allows techniques such as baud rate hopping. I have implemented such a scheme for a number of organisations, and their computer systems have never yet been 'broken into'.

As far as the German Enigma machine is concerned, it should not be dismissed too lightly. An emulation of that machine (with improvements) is sold by one of the major software houses for the TRS-80. They also offer an encrypted message, which if you like to send in the solution, they will pay you £250. The prize has not yet been claimed, although I know for a fact that the message has been decrypted by a few people, but they are not in a position to publicise the fact.

Finally, I must say that if your correspondent seriously

thinks that there is a lot of misinformation on the subject, then it shows just how little he knows about it.

Printing pokes

After buying a Seikosha AGP50A printer I discovered that the LList command did print the program lines, but the printer did not linefeed after each line, thus printing the entire program on the same line.

To correct this, *Poke 330,2* to enable the linefeed after each line. Type *Poke 330,1* to disable linefeed.

Other Pokes that may be of use when printing are *Poke 329,255* to put upper case 'on' and *Poke 329,0* for lower case.

Neil Ritchie
35 Underwood Ave
Worsbrough
Barnsley
S Yorks

Thank you for the Pokes. If any other readers have any interesting Pokes or routines, please send them in.

Overloaded cables

This is just to let you know that my wife has threatened to leave me, the bank manager has written to me advising that I should go back to work and the electricity board have replaced all the street's cables due to an overload originating from my home.

'Why' I hear you ask. 'Jet Set Willy' I reply. It must be one of the most addictive and frustrating games ever (Manic Miner bites the dust).

To date, I have stumbled across 55 screens and found 73 items (not collected them all yet though). Can there be any more I ask myself?

Enough of the praise — lets get down to the nitty-gritty. One side of my tape doesn't load, which isn't too bad as I

have still got the other side. But, after about 30 minutes playing, sometimes the program corrupts itself and I find that if I enter the kitchen, under Megatree or the East Wall base, Willy automatically gets killed off for no apparent reason. Should I change my tape or not?

Simon Lilley
21 Roberts Street
Rushden
Northants

From the sound of it, the side of the tape that loads is perfectly OK. It may be that the Spectrum is overheating, which could cause the program to corrupt itself.

I would advise trying the program on a friend's machine. If the same problem occurs, then the tape is probably faulty and should be exchanged. If the problem does not occur, then the fault probably lies with the machine.

Ace on Spectrum

I own a 48K Spectrum and Abersoft's Forth. Can you tell me if there is a possibility of running Jupiter Ace listings on my Spectrum with my Forth program loaded?

Also, are Eproms available for the Spectrum? If so, how much do they cost and are they available from retailers?

Please could you settle a slight argument between myself and my friends. Which do you think is the best joystick, The Quickshot (original), the

"... Complaining to the Advertising Standards Authority about Sinclair helps to pass the time while I'm waiting for my QL."

Kempston competition Pro 5000, or the Pointmaster Pro?

Paul Bryant
33 St Marys Rd
Gillingham
Kent ME7 1JJ

A Jupiter Ace listing might run on your Spectrum, if you avoided all graphics and Pokes.

Eproms are available for the Spectrum. Eprom Services, 3 Wedgewood Drive, Leeds LS8 1EF, offers an 8K Eprom board complete with a programmed toolkit Eprom for £20.95.

As for the joysticks, it's very much a matter of taste, but I'll admit to being slightly inclined towards the Kempston.

Software exchange

I am writing in response to a letter in your April 12 issue headlined "Ban the swap shops". The writer seems to make a dangerous assumption about software exchange clubs such as UK Software Exchange Club. The inference is that programs members will receive in return will be pirated copies.

As far as my own club is concerned, nothing could be further from the truth. If the author of that letter would care to name names concerning who is offering pirated copies, then action could quickly be taken against the offending clubs.

I suspect that the writer was meaning to say that it was private individuals who were responsible for these sort of offers, but the point was not clearly made and I feel that I should have the opportunity to set the record straight.

My club deals solely in originals which must be complete in every respect including all documentation. If anyone wants to be sure that they will not receive pirated programs in return for their exchange software, then they should avoid the adverts which look too good to be true and stick with an established club such as UKSEC.

Tank Battle

A new game for 48K Spectrum by Julian Chowdhury

This arcade style game is called *Tank Battle*. The object of the game is to blast the tanks coming up the screen. But be careful! The tanks can fire back at you, diagonally left and right, and straight up. The direction is purely at random. You have only three lives and must, obviously, avoid the tank fire.

Blasting enough tanks will move you to the next level where your fuel will be restored and a bonus will be given. The highest points will be given for hitting the tanks on their turrets when they are far away.

The program could be speeded up slightly by taking out the Rem statements or re-

moving the sound.

Christina Erskine talks to Clement Chambers of CRL

The legend of the computer whizz-kid earning a million before the age of 18 is almost personified in Clement Chambers. Not quite, because Clement has now turned 20, and he's not a millionaire — yet.

Clement has been managing director of Computer Rentals Ltd for close on two years now. He can hardly be said to have worked his way up from the bottom.

"After leaving school, I wasn't entirely sure what I was going to do because I was far too thick for university," he said wryly. "I didn't particularly want to work for anyone else, so it seemed a good idea to set up my own company."

His first idea for a business explains the company's somewhat inappropriate name.

"I started out with plans to rent out hardware, but negotiations with the manufacturers fell through, so I was left with a company, but no product. I decided to have a go at the other end of the market and sell software instead."

Not that Clement was at all worried by his false start. He was attracted by the fact that the computer market was new and undeveloped, and he hoped he wouldn't need a vast amount of capital. Supreme youthful confidence convinced a bank that lending him £30,000 would reap dividends, and a half page advertisement in a computer magazine gave CRL its first six programs.

"The response to that ad was even better than I'd expected. I'm still getting the occasional reply to it now."

"After that, things grew extremely quickly. I'd paid off the bank in two months, and I had to take on more staff fairly fast. CRL began with me and a part-time secretary in 500 square feet above a Whitechapel tailors."

"Then Tim Vernon arrived to deal with sales, the secretary went full-time, and Ashley, an old schoolfriend, who'd been helping with the administration on an informal basis, joined the payroll."

CRL's next venture was the production of a Z80 based, infra-red driven robot. It was made by a team of schoolboys from Ilford County High School, and Clement took them all to Madrid for the Robotics

World Championships where it won a prize in the Novices section.

"We're currently developing the robot for the commercial market, but its launch has been considerably delayed by the shortage of chips. But we've got two people working on it at the moment and when it does come out, it'll be under £100."

In October 1983, CRL moved to self-contained premises in Stratford, and Clement began raising its profile.

"I stopped driving my Mini Metro, and bought a BMW. It was bad enough when people looked down their noses at me because of my age, but I stood no chance at all with a Mini. Then I spotted an advertisement in *The Times* for the number plate CRL 1. It set me back £3,000, but I get taken a lot more seriously now."

CRL has now published over 40 titles, and exports widely to countries as diverse as Iceland and New Zealand. It also has two particularly big projects on hand at the moment.

One is the adventure game *War of the Worlds*, based on Jeff Wayne's music — rather than HG Wells' book — and with a target launch date of June 1.

"The venture started almost by accident," said Clement. "One of our programmers wanted to call his latest program *War of the Worlds*, and I pointed out that the title already existed. But the name and idea stuck in my mind. It occurred to me that it would make a very good game itself."

"Having found out that Jeff Wayne held the rights to the name, we came to an agreement, and set about turning it into a program for the Spectrum."

"The music will play continuously

add some new ones as well.

"Actually, all we've got so far is half an hour's worth of landscape, but I'm confident it'll be finished on time."

The second project is to produce a game based on *The Magic Roundabout*. Clement is in the process of tying up a deal to give CRL the rights to the title. Fans of Zebedee and Florence *et al* will doubtless be glad to hear that there will be no shoot-outs or intergalactic warfare involved.

"We're thinking along the lines of a non-violent arcade game for a number of machines," Clement explained, "but it's hardly got off the ground yet, so I don't know quite how it will turn out."

Not that CRL will run down their normal games output. With five programmers among the 11 full-time staff, a new game is expected to begin production about once a fortnight, including conversions of existing games for different machines.

Clement however would like to see CRL grow bigger and bigger.

"While CRL are not going in for expansion just at the moment, we'll certainly be ready to compete when the stakes go up. And I can see a lot of software houses — the smaller ones — going broke within the next nine months, while the large companies get bigger."

"In the long term, I think the computer industry will stay healthy, and I can see software gaining the same status as records and tapes have now. It won't be long before the home computer is as familiar as, say, the television or telephone, in people's homes."

Clement Chambers should certainly be around to see if his predictions come true — after all, he's got at least another 40 years of work ahead of him.

The latest in Carnell Software's third continent series of adventures.

11TH ZX MICROFAIR. ALLY PALLY APRIL 28TH

ZX MICROFAIR has become a household word for anyone interested in discovering what's the latest gizmo for their SINCLAIR computer!

A good day out at a reasonable price and an enjoyable day spent amongst friends and fellow enthusiasts!

Let's face it, what other exhibition gives you so much for so little?

Where would you find under one roof all the latest hardware, software, books, user groups, programming aids, peripherals and add-ons for your Sinclair Computer?

There's even a bring-and-buy sale, bars, buffets and a place to relax after a hard day's looking!

So book your place now by sending for an advance ticket at reduced cost.

But don't forget the date: ALLY PALLY
28th APRIL 1984. See you there.

Saturday 28th April 1984 10am - 6pm.

ALEXANDRA PAVILION, ALEXANDRA PARK, WOOD GREEN, LONDON N22.

SEND TODAY FOR REDUCED PRICE ADVANCE TICKETS!

Post to Mike Johnston, 71 Park Lane, Tottenham, London N17 0HG.

Please send me the following advance tickets for The ZX MICROFAIR on 28th April 1984:

..... Adult tickets @ £1.00 each

..... Children (under 14) tickets @ 50p each

PLEASE ENCLOSE A STAMPED ADDRESSED ENVELOPE AND
MAKE CHEQUES/POSTAL ORDERS PAYABLE TO ZX MICROFAIR.

NOW AT LAST!

Cuthbert

ON THE

Commodore 64

Yes at last those fantastic top selling games for the Dragon are now available for your Commodore 64. Avoid those Marauding Moronians in "Cuthbert Goes Walkabout". Fight for survival in "Cuthbert in the Jungle" or plunder the Moronians planet in "Cuthbert in Space". These great games are a "must" for your software collection.

Value for money

Andy Pennell looks at the new Amstrad micro which could challenge the dominance of Sinclair, Commodore and Acorn

As revealed exclusively in PCW January 5-11, Amstrad have launched a computer that looks as if it could beat Sinclair, among others, at its own game. Amstrad has for some years been producing cheap hi-fi equipment and, more recently televisions and videos. Its new range of micros extends their philosophy.

Amstrad was the first to package hi-fi separates together in one box, and its micros use a similar idea that packages a monitor and a cassette deck along with the main unit, starting at the ridiculous price of £229. There are two models at the moment, both consisting of the CPO 464 main console with inbuilt cassette unit, one supplied with a green screen monitor, for £229, and the other supplied with a colour RGB monitor, for only £329. The machine itself comes with 64K of Ram and 32K of Rom, with high-res colour graphics and sound. At the heart of the machine is a Z80A processor, as used in many other machines including the Spectrum, which has the advantage over other processors in that it can run CP/M.

Of the 64K Ram, 16K is dedicated to the screen display, leaving around 42K available to the user, just a bit more than in the Spectrum. The screen has three modes — in mode 0, there are 16 colours selectable from a palette of 27, with a resolution of 160x200, which is not bad. In mode 1, four colours can be displayed at one time, again from a palette of 27, with a resolution of 320x200, which is good. Finally, mode 2 is the highest resolution, with two colours available at a resolution of 640x200, which is excellent.

The number of characters per line in these modes are 20, 40 and 80, respectively. This latter figure is most important for business applications, and in particular CP/M.

The sound on the Amstrad is very good, using the ubiquitous AY-3-8912, giving three channels. The channels are mixed to give a mono output on the internal loudspeaker, via a volume control, and there is also a mini-jack socket that gives 'stereo' sound output. The stereo is obtained by mixing the channels together differently, to obtain pseudo left and right sound.

So much for the insides of the machine, what of the outside? The keyboard consists of 74 keys in all, in three groups. The main group is the QWERTY section, along with a nice long space bar, and massive Enter key. The keys themselves are very nice to type on, and are as good as on any home micro with a proper keyboard. There is also a numeric pad to the right of the main cluster, and a small cluster above it consisting of the cursor keys and a Copy key, for editing. Personally, I would have preferred the cursor keys to be part of the main group, as they really are too far away.

To the right of all the keys is the inbuilt cassette unit, or 'datacorder' as Amstrad like to call it, which consists of a bog-standard cassette recorder, with most of the audio electronics removed. Although all connections are internal, so there are no external leads to worry about, the computer does not actually control the recorder. The operator still has to press the relevant keys when required. Thoughtfully, a tape counter is included, along with a Pause button — would someone please tell me what use Pause is on a computer tape recorder?

Directly above the keys is a little coloured drawing, which serves no useful purpose, other than to fill up what would otherwise be an empty space on the fascia. Amstrad's hi-fis all have little graphs on their facias, presumably for a similar reason.

The monitors supplied with either system

are a necessary part of it, as they contain the power supply for the main console. The colour monitor is based on an Amstrad tv with most of the electronics removed, requiring RGB input. The picture obtained is very nice indeed, certainly better than is possible on a domestic tv, but not quite as good as the better class of monitors available separately. However, the monitors that do give a better picture are more expensive than the Amstrad monitor and the computer together, so many people may feel that for £329 they can get a good RGB monitor, together with a 'free' computer, and a good one at that!

Eighty columns can be displayed clearly in colour, though for extensive work I would prefer a good quality b/w monitor, such as the one supplied with the cheaper model.

which gives a nice picture, with true grey-scale. For those that buy the cheaper system, for about £30 a modulator is available so that it can be hooked up to the domestic colour tv, with the unavoidable loss in picture quality.

The Basic occupies 16K of the Rom, and was written by a company called Locomotive Software. This name is particularly apt, as it is one of the fastest Basics I have seen, and is based very much on Microsoft. Thankfully, Amstrad has more thought for the user than companies such as Commodore, and have extended the Basic to cover all the hardware aspects of the machine, as well as being able to call the operating system.

Rear view of the CPC64. From left to right: monitor, power input, disc interface connection, printer port, joystick port, stereo sound output

Apparently, the Amstrad used the BBC micro as its model, but unfortunately the Basic does not have many of the structured features of the Beeb. However, it does have a function similar to the Beeb's 'FX' command, for accessing the operating system, as well as a command for using any of the sideways Roms, up to 240 of which may be fitted. The Basic gives the user windows, to a fashion, for printing text and graphics, but they are not up to concurrent CP/M or QL standards. There are lots of easy to use graphics commands, for both absolute and relative plotting, and colour is controlled by sensible Ink, Paper and Pen commands.

As with the Spectrum and others, streams are used for input/output, and on the standard machine these are eight streams for the screen windows, one for the printer (via the parallel port), and one for the cassette unit. If a peripheral such as a serial port or disc drive is added, other streams can be defined for them.

The Amstrad's Basic also has an almost original feature — that of controlling interrupts. It has the After and Every commands, that wait a defined time, then do the equivalent of a GOSUB. The difference between them is that Every occurs regularly, but After triggers the routine once only. The only other Basic to come near this is Basic-G, available as an extra for the CGL/Sord M5, which extends the idea further to include interrupts triggered by key presses and joystick movements.

When entering Basic programs, the editor used is a cross between the much maligned Microsoft line editor, and the BBC method of using Copy to read characters from other parts of the screen, and

Detail of numeric keypad, cursor controls and built-in cassette unit

Locomotive have used the best features of both.

If all goes to plan, and there seems little that could stop it, the Amstrad machines should be in the shops by June, in four selected retailers only — namely Rumbelows, Comet and Boots. Although not available quite as soon, CP/M will be available, and was demonstrated at the launch. The design is finished, but production has not been started, and the first drive and interface will be about £190, with a second drive available at £150. Instead of the more usual 5 1/4" drives, Amstrad have opted for the Hitachi 3" format, though in

theory at least other drives could be used. The CPC 464 with b/w monitor and single drive will be a ridiculous £429, with a colour version for £529, making the Amstrad the cheapest CP/M machine to my knowledge.

Also shown at the launch was just some of the software that Amsoft, the software side of Amstrad, will be releasing. Much of it originally came out on the Spectrum, such as *Harrier Attack*, *Boogaboo the Flea*, and Hisoft's Pascal. The machine itself and its firmware has been finished for a couple of months now, so there should be none of the QL-type delays while bugs are ironed out of it. The forthright of Amsoft supplying machines to certain software houses in advance must be applauded, a feat few other companies in the market have matched.

How does it compare with the competition? Well, I think Amstrad are the first people to offer better value for money than Sinclair — for around the price of a QL, you will be able to get a CPC 464, disc drive and b/w monitor in a shop, without the delay of ordering by mail order, and with CP/M you have (theoretically at least) access to practically any piece of business software, instead of waiting for everyone to create from scratch programs to run under QDOS, and duplicate them on Microdrive.

I think the Amstrad will give a lot of sleepless nights to Sinclair, Acorn and Commodore, and nightmares to Memotech and Enterprise/Elan. I think it could turn out to be what the QL could, and should, have been — a terrific home micro, with an awful lot of potential as a business machine. It's just a shame that a machine conceived and designed in Britain has, because of import duty, to be manufactured in Korea. Those, myself included, who said that QL was going to be the micro of the year could prove to be rather short-sighted.

At last...

NOW
MICRODRIVE
COMPATIBLE

The
intelligent
Joystick

A joystick that works!

Cambridge Computing bring you
the first **programmable** joystick~
at a price you can afford.

£34.90

JOYSTICK, INTERFACE
AND TAPE COMPLETE

Interface

- 1k on board memory
- Own rear edge connector — for printers etc.,
- Compatible with all standard joysticks

Joystick

- Self centring
- 8 Directional microswitched action
- 2 independent fire buttons

Tape

- Easy to use program enables the interface to work on ALL software
- Keeps a record of all your games — so you only need to tell it about each game once!

For Spectrum

I enclose cheque/postal order* for £.....
made payable to Cambridge Computing Limited.
*delete as necessary.

the LLAMA has LANDED!

..... and it's breeding fast.

Once upon a time, only Commodore owners could experience the thrill of playing an original game by Jeff 'Awesome' Minter. Lesser mortals could only sit and stare in wondrous rapture at the furry arcade action brought to you by Llamasoft.

BUT NOW THERE IS HOPE.

Dragon owners were the first to see the light of day, but now Salamander Software is pleased as punch to announce that selected titles **ARE NOW AVAILABLE FOR THE 48K SPECTRUM.**

Yes that's right, Salamander is now producing titles for the Spectrum, and the first of these are two great arcade games. ...

METAGALACTIC LLAMAS BATTLE AT THE EDGE OF TIME

On a forlorn observation post at the edge of the galaxy, the Metallamas wait for a sign of Zzvaxian spaceships. Suddenly the alarm claxons blare, and the furry friends of freedom rush to the fore only to find that there are no attacking spaceships, and that they are under attack from Cyborg Arachnid Mutants and Disgusting Weeviloids. ...

This classic arcade game, originally developed by Jeff 'Awesome' Minter of Llamasoft, features 1 and 2 player options, spitting Llamas, Cyborg Arachnid Mutants, Disgusting Weeviloids, 99 levels of play, Joystick recommended. Supports Spectrum ZX Interface 2 and Kempston joysticks.

MATRIX: GRIDRUNNER II

It is ten years after the infamous Grid Wars, and humanity is once again threatened by the evil droids, only this time they're back in force with new weapons and new allies.

The awesome sequel to the best selling Gridrunner, Matrix features all the old favourites like Droids and Zappers, but increases the panic quotient by adding Diagonal waves, Cosmic Cameloids, Energy deflexors, the Snitch and more.

Game originally developed by Jeff 'Awesome' Minter of Llamasoft. Joystick recommended. Supports Kempston and AGF joystick interfaces.

In space, only the camels can hear you scream.

What some famous people have said ...

"What's an arcade game"	Aristotle
"Awesome"	Jeff Minter
"I prefer elephants"	Hannibal
"Don't shoot me, I'm only the piano player"	Elton John
"Boing"	Zebedee

Please add 50p P.&P. to all orders. Send A5 SAE for full catalogue.

Bubbling over

Ian Goldsack presents a bubble sort program for the BBC

This small routine gives a visual display to help a pupil understand and remember the process involved in a bubble sort. It can run at six different speeds, and therefore can be used for a variety of purposes.

On its fastest speed, it can be used simply to sort up to 20 strings of letters, numbers, or both into order. As the sorting is based on the ASCII code of each character, numbers come before letters. For the same reason, lower case letters come after upper case.

In any of the slower modes, the program can be used as a demonstration for students. It is also useful to a beginner of any

age who has a text book explaining the bubble sort, but is not sure how to interpret the pages of incomprehensible text with no examples.

As well as displaying the number of words to be sorted, this program also displays the number of passes which have been made by the bubble down the screen. In a very basic version of the bubble sort, this would always finish up being the same as the number of words sorted. However, with the bubble sort it is possible to introduce several time saving features. One of these is the decrementation of the variable X during the main sorting routine.

Another very common technique used during this type of sort is the use of the FLAG. If during one pass of the bubble through the array, no change is made, obviously all the elements of the array are in order and therefore there is little point in continuing with the time consuming sort.

The program has been written in a way which makes it reasonably easy to convert for any micro. All the VDU's in the program are used to change the colour of the text, etc, and should not present many problems to an experienced programmer. The Tab command on the BBC is slightly more advanced than that on most micros and is in the form: Tab (Horizontal co-ordinate, vertical co-ordinate).

On the BBC, the program uses Mode 0 (the 80 character mode), and so may not be clear on some ordinary television sets.

Shake, rattle and roll

Mark Lawence presents a character generator which will rotate, invert, mirror and scroll

While using the character generator on the *Horizon* tape, I thought it would be nice to have such facilities as rotate, invert, mirror and scrolling, which are available on commercial programs. This would greatly speed up character generation, as it is sometimes necessary to have the same character, such as a pacman, defined in four directions or to have a mirrored image of a character.

Instead of adding these facilities to the *Horizon* program, I decided to write a complete program. I also decided to write it in machine code as this would mean you would not have to wait while the character is rotated, scrolled, etc. This program fits my

requirements and will hopefully be useful to others.

A good character generator is not only of use to games programmers — I used this program to develop the characters for a program I was writing which allows you to print 64 characters on a line.

The character generator is 1352 bytes of machine code, plus a short Basic program to load the code from tape and run it. This Basic program should be typed in first and saved by entering *Save 'char gen' Line 1*, then verified. Now type in the hex loader and load the code to address 31000 then *Save 'gen code' Code 31000, 1352*. When you have verified this, by entering *Verify*

Code, type *Randomize USR 0*, to clear the machine, and rewind the tape to the start. Type *Load* and start the tape.

If all is well, the Basic program should load; auto-run, load the machine code and run it. This should produce a display of an 8 × 8 grid, the user definable character set and a menu. If it does not, type in the check program and check your code against the listing, *Poking* any incorrect values.

The menu should provide all the information needed to use the program, although the scrolling option may need a little explaining. The keys 1 to 4 act as scrolling keys in the same way as keys 5 to 8 act as cursor keys, so 1 scrolls left, 2 down, 3 up and 4 right. Pressing 2 changes mode from plot to unplot or vice versa. Plotting mode produces a flashing black/cyan cursor and unplot produces a flashing white/cyan cursor. The cap shift key is used to return to Basic. Type *Goto 20* to return.

**NOW YOU CAN LIFT STATIC DRAWINGS, PHOTOGRAPHS, ETC RIGHT
OFF THE PAPER AND BRING THEM TO LIFE INTO YOUR PROGRAM!**
TWO POTENT FEATURES COMBINE TO BRING YOU UNIQUE NEW POWER OVER YOUR SPECTRUM GRAPHICS!

● **ACTION-TRACER** Gives you the power to transfer drawings, photographs, paintings, lettering - in fact ANY paper-based images into full colour line drawings on your Spectrum screen, with astonishing ease and an accuracy that rivals expensive digital tracers. But this time you get more than just a static on-screen design that has to be laboriously drawn on and off tape, because...

● **GHOST-WRITER** Interprets your on-screen sequence of basic instructions needed to EXACTLY reproduce it, and then writes the program for you, directly into memory! New program lines appear in your listing which are indistinguishable from ones you might have written yourself. When you've finished, POWER-GRAFICS will 'self-destruct', leaving behind only your new program lines ready to use.

TOGETHER THEY'RE DYNAMIC!
The new program captures your design DYNAMICALLY, giving you instantly the power to MOVE it anywhere, to SHRINK it down to a single pixel, or EXPAND it to fill the screen. You can SQUEEZE or STRETCH it into weird distortions, flip it UPSIDE DOWN or MIRROR-IMAGE it, ROTATE it in the plane of the screen... in other words MANIPULATE IT UNDER YOUR FULL CONTROL!

FROM PAPER TO SCREEN...
...AND INTO YOUR PROGRAM.

**POWER
GRAFICS**

ACTION-TRACER + GHOST-WRITER
LARGE-TRANSFER SYSTEM PROGRAM COMPILER

Once GHOST-WRITER has captured Space-Shuttles, you can immediately reproduce it anywhere, any size, AND redesign it too!

No problem producing mirror-images... and turning them upside-down is just as easy, too!

Drawing a simple cross-section (above left) and rotating it through the plane of the screen to produce exotic architecture is just a peep into a whole new ABC by GHOST-WRITER's versatile programming.

MANIPULATION OR ANIMATION - GHOST-WRITER ALWAYS WRITES EXACTLY THE PROGRAM YOU NEED!
You can tell GHOST-WRITER to program selected parts of your design with their own special line numbers, allowing you to call them as separate sub-routines. Thus you can add or remove parts at will - like the Sunken burner in this chemistry diagram.

INSTANT FORGERY!
How would you like to write a program that signs your name exactly as you do yourself?
John Smith
It's just a few minutes' work with POWER-GRAFICS!

Animating the lips of this well-known newswoman (recognise her?) is just as simple - and thanks to POWER-GRAFICS' ability to produce high-speed curves when needed (which draw as fast as straight) her curved lips can be animated in real time.
POWER-GRAFICS is fun to use, simple in operation, and for beginners and advanced users alike is an important new programming tool that extends the Spectrum's potential for imaginative graphics into exciting new regions.
IF YOU WANT PICTURES YOU CAN USE, IT HAS TO BE POWER-GRAFICS.

POPULAR COMPUTING WEEKLY

No such number

Jason Orbaum and Geoffrey Campbell explain some of the intricacies of different addressing modes

Last week we showed how the Dragon represents numbers in binary, and the internal organisation of the processor. Obviously, this processing power is of no use unless the numbers obtained can be stored for later access and further processing.

From machine code, this is achieved using the **ST** command, and, to retrieve a stored number, **LD**. Both these commands must have a register and an address specified. Thus, if we wanted to store the contents of the **A** register in address 2000, then we would write:— **STA 2000**.

Conversely, to load the **A** register with the contents of address 2000, we would write:— **LDA 2000**.

Now, in some cases, we might want to load a register with a number, not the contents of an address. To load the **A** register with 100, we would write:— **LDA #100**.

This is using a different addressing mode. There are, altogether, five different addressing modes:

INHERENT — this mode does not use an address. Examples are some forms of **INC**, **DEC**, and **CLR**.

DIRECT — this mode uses the specified address to operate on, but can only take a short address, that is, a one-byte number. It is fairly limited, but is faster than **EXTENDED**.

EXTENDED — essentially the same as the **DIRECT** mode, this acts on a two-byte address, and can therefore act on any address in memory. It takes more memory to store a command in **EXTENDED** mode, but the command will be more powerful.

RELATIVE — this mode is used with the branch instructions, and will be covered more fully next week.

INDEXED — this mode uses the index

registers to modify the address acted on, so that it is possible to use arrays from machine code. The command **LDA X** will load the **A** register with the contents of the address pointed to by the **X** register. Thus, if the **X** register contains 2000, the **A** register will now contain the contents of address 2000. The same thing can be done with the **Y** register.

Also, a base address can be specified, so that **LDA 2000,X** will load the **A** register with the contents of address (2000+X).

INDIRECT — this mode takes the address to be operated on as the contents of the specified address. If address 2000 held 100, the **LDA (2000)** will load the **A** register with the contents of address 100. This can be used to specify two-byte numbers, as the specified address if taken as one part of a two-byte number, so with address 2000 specified, addresses 2000 and 2001 are used to contain the final address.

If we wanted to put zero into address 2000, we could write:

```
LDA #0
STA 2000
```

but this is clumsy and it would be simpler to have a command to set an address to zero. The command to do this does exist, and the example could be replaced by:

```
CLR 2000
```

This can also be used on registers, so that **CLR A** will set the **A** register to zero. Note, though, that this instruction only works on a one-byte number, so that, to set the two-byte address at 2000 and 2001 to zero, we would have to write:

```
CLR 2000
CLR 2001
```

Most of the arithmetic functions will be dealt with in a couple of weeks, but two useful ones that we will use in this article are **INC** and **DEC**. These mnemonics stand for increment and decrement, or add one and subtract one. They can have two forms:

```
INCA
DECB
```

```
INC 2000
DEC 2001
```

This example will add one to the contents of the **A** register, subtract one from the contents of the **B** register, add one to the contents of address 2000, and then subtract one from contents of address 2001. Note that the first two instructions are **INHERENT** addressing, while the last two are **EXTENDED** addressing.

Of a similar form are the **LEA** commands. There are two of these, **LEAX** and **LEAY**. The **LEA** stands for 'Load Effective Address', and the commands are used to add to, or subtract from, the **X** and **Y** registers. The main use of this is to modify indexed addresses. If we wanted to add two to the **X** register, we would write:

```
LEAX 2,X
```

and similarly for the **Y** register:

```
LEAY 2,Y
```

SPEEDY DELIVERY GUARANTEED

New from **SUNSHINE** Master your ZX Microdrive

programs, machine code and networking by Andrew Pennell

Master your ZX Microdrive contains all the information you will ever need to use the ZX Microdrive to the full. Clearly explained, with many examples, it is equally suitable for the relative newcomer to BASIC through to the experienced machine code programmer.

Andrew Pennell has also included a full database file handling program to let you put the ZX Microdrive to practical use with your Sinclair Spectrum.

Look out for the Sunshine range in W.H. Smith's, Boots, John Menzies, other leading retail chains and through our national network of book shops and specialist stores. Dealer Enquiries: 01-437 4343

FED UP WITH THE SPECTRUM'S DISPLAY? PEEKAY SOFTWARE HAVE THE ANSWER

40 x 24 screen £4.50 inc p&p

Perfect for connecting your Spectrum to other computers, as this is the world's standard screen format for home computers.

64 x 32 screen £4.50 inc p&p

The ultimate SCREEN CRUNCHER: just right for programmers and business users. You'll be amazed when you see how clear the characters are!

Both programs MERGE with your BASIC software. You need not alter any part of your programs to convert them to the new screen format. If you would like to see before you buy then send us £1 for our Screen Demo Tape, your £1 will be refunded when you buy one of the programs. Alternatively ask your computer shop to show you the demonstration cassette.

Send to: PEEKAY SOFTWARE, DEPT PCW,
38 BERTON CLOSE, BLUNSDON, WILTSHIRE, SN2 4BE.

Remote control

John Myerscough presents a program to turn the BBC into a time switch

For those people like myself who cannot be bothered to stay up until twenty-five past twelve twice a week to record the Basicode programs being transmitted by the BBC on Radio 4, here is a short program to turn the BBC microcomputer into a time switch.

The program can also be used to remotely record any other type of audio program — from *Gardener's Question Time* to the

Archers at any preselected time.

To record programs at predetermined times the BBC micro is connected to a radio-cassette player or similar device with a motor control. Only the motor control lead need be connected from the radio-cassette player to the micro. If the motor control is part of a 7-pin Din plug arrangement then you will need to experiment to ensure this does not affect the recording quality.

To make the micro behave like a time switch first load and run the *Programmable Timer Switch* program. Then turn on the radio and set the cassette to record. Once the program is run the tv can be turned off as it plays no further part in the proceedings.

The computer program itself is fairly straightforward. Once the program is run the time delay before the cassette recorder is activated can be varied using the F0 and F1 keys.

The listings is for a 1.2 OS BBC machine, but it will run on a 0.1 OS BBCf simply by changing the cursor-off command in Line 40.

More developments from:

Microholics Anonymous

For readers who did not see our previous ad in this journal we present below a list of the features of ULTIMON, the ultimate machine code monitor for the ZX Spectrum. Shortage of space prohibits us from providing a more complete description but if you have specific questions or you would like more information then please telephone our technical enquiries number (below) with your enquiry when we will be pleased to give you our personal attention.

Features of ULTIMON:

- Exerts total control over program under test (RAM and ROM)
- Up to twenty (non overwriting) break points (RAM or ROM)
- 'BREAK' key interruption (as in BASIC)
- Break on change of specified register/memory contents
- Detects and breaks on out of bounds jumps, invalid op-codes and stack pointer mis-use
- Single instruction stepping
- Traced execution allows you to watch your source code 'execute' at your chosen speed
- Selectable constant display window allows continuous monitoring of program execution status without corrupting its video display
- Disassemble RAM/ROM on request
- Display memory in combined hex/character format
- Alter/copy/search areas of memory
- Video RAM swap facility (selectable) maintains discrete video displays for monitor and test program — ideal for graphics/games program development
- Full ZX printer support
- Microdrive Compatible
- Hexadecimal calculator and hex/decimal conversion
- 'Hot' keyboard input with full repeat key capability for minimum keying
- Completely transparent to the program under test
- Comprehensive user manual packed with information and containing a full sample session for easy understanding

NEW!

Version 2 of ULTIMON is now available. If you thought ULTIMON could not be improved you were wrong! Version 2 is completely RELOCATABLE and will execute anywhere in RAM. In addition there is now a selectable facility to specify unmonitored execution of routines which have been fully de-bugged, thus speeding up execution of your program dramatically.

Existing users may upgrade for a nominal fee and at the same time receive our FREE Aspect/ULTIMON interface program. Telephone our technical enquiries number below if you require more details.

NEW!

Following the successful launch of ULTIMON, the ultimate machine code monitor we have now decided to make generally available the complete 48K Spectrum integrated assembly language development system which we ourselves use for software development.

While providing the ideal learning environment for newcomers to assembly language (definitely the most satisfying and rewarding of languages), the development system is also powerful enough to permit development of programs well in excess of 2,000 (yes, two thousand!) instructions in size (48K Spectrum).

The whole package comprises three components, BUG-BYTE's Aspect 4.2 Editor/Assembler (suitably improved), the incredible ULTIMON and our own custom-written automated interface program, all of which reside simultaneously in RAM and still leave space to develop programs of the size mentioned above. Of these components, new or upgrading ULTIMON users pay only for ULTIMON and/or Aspect, the interface program being FREE OF CHARGE.

This interface program includes a replacement keyboard input routine for Aspect (providing additional features), comes in both machine code and assembly language formats and is completely free of copyright restriction. Together these provide the following features:

- Saving and loading of the source program (alone, not Aspect as well!)
- Transfer of control to Aspect or ULTIMON
- Storage (de-)allocation for ULTIMON video-swap
- ZX print of the source program (each of the above requires only a single key depression!)
- the ability to alter the Aspect symbol table/source buffer sizes
- Fully de-bounced keyboard, flashing cursor, repeat key capability and BASIC-type 'click'.

Prices (incl. VAT, P&P):

ULTIMON V2	£12.50 (new users)
ULTIMON V2	£2.50 (upgrade for existing users)
Interface and K/B rtn	FREE with ULTIMON purchase or upgrade
	£2.50 without ULTIMON
Aspect 4.2 (Bug-Byte)	£6.95
ULTIMON ref manual only	£1.50 (refundable on ULTIMON purchase)
Complete ULTIMON/Aspect/Interface package:	£18.95

SPECIAL OFFER TO USERS OF INFERIOR MONITORS!

Send us your old ZX Spectrum machine code monitor (ALL original materials in original packaging please) and save £3.00 on the purchase price of ULTIMON! Yes, the whole package for only £15.45 (£9.50 for ULTIMON alone).

READY FOR THE FLAT SEASON

COURSEWINNER

THE PUNTERS COMPUTER PROGRAM

COURSEWINNER allows you to use the power of your computer to get the edge on the bookmaker. The program contains a database full of detailed information on all English and Scottish flat courses. The ten leading trainers and jockeys, and effect of the draw for different weight carried and race length is detailed for each course. This information can be displayed on the screen for reference at any time.

COURSEWINNER can be used in two modes — quick mode requires only the starting price and results of the last three outings (as found in any newspaper) for each runner. Extended mode allows detailed analysis of the following factors:

- Recent form and starting price
- Weight carried and Race length
- Trainer and jockey form for the course
- Effect of the draw and of the going
- Also included in the package is a utility which calculates the returns on any single or accumulator bet, win or place, tax paid and deducted.

Available for: SPECTRUM (48K), BBC (B), COMMODORE 64, DRAGON, APPLE II/IIe, ATARI (48K)

Price £12.50 all inclusive

POOLSWINNER

THE ULTIMATE POOLS PREDICTION PROGRAM

POOLSWINNER is the most sophisticated pools prediction aid ever produced. It comes complete with its own massive database.

Fully menu driven. Simple to use, yet very powerful. Predicts SCOREDRAWS, DRAWS, AWAYS and HOMES.

Selec Software guarantee that POOLSWINNER performs significantly better than chance. Your prospects of dividends, and perhaps a jackpot are greatly enhanced.

POOLSWINNER automatically calculates the league tables as the season progresses. The tables for any division can be displayed for reference at any time.

THE DATABASE supplied with the package is the largest available — over 20000 matches (10 years league football). The database automatically updates as results come in, allowing the program to adapt to recent changes in patterns.

POOLSWINNER is for use with English and Scottish league matches, or cup matches between league sides. The program can be used for all future seasons.

The package is complete with program, 20000 match database, and detailed instruction booklet.

Available for: SPECTRUM (48K), ZX81 (16K), BBC (B), COMMODORE 64, DRAGON, APPLE II/IIe, ATARI (48K)

Price £15.00 all inclusive

Immediate dispatch (return of post)

PHOTON

MACHINE CODE WRAITH/DISASSEMBLER
FOR 48K ZX SPECTRUM

WRAITH: single-steps thru m/c programs (discover how the ROM routines really work); full display of all registers and flags showing previous and current values; stack details; interrupt mode, enable/disable status; assembly language mnemonics; screen and attribute file for graphics programs (switch between PHOTON and your display at any time!); single registers in binary at any time; user specified bytes and words displayed continuously; user initialization of any/all registers/flags.

Z80 DISASSEMBLER: automatic labelling (!); informative symbols; binary data for logic operations; address, mnemonic and m/c in DEC or HEX (any combination); lower or upper case mnemonics; error and f-p calc restarts handled correctly; unconditional JP, JR, RET, CALL shown flashing; labelled disassembly placed in basic program (hidden line nos.!) so it is simple to send to printer or microdrive; any block of lines easily removed from basic. **DEFB:** you specify data block, PHOTON gives DEC or HEX contents with character.

ESCAPE FACILITY: forget keyboard lock-ups! PHOTON allows you to break out of your m/c program at anytime (even if it includes an interrupt routine).

PHOTON is a full colour, menu driven, machine code program and is accompanied by comprehensive instructions.

**SPECTADRAW 2 — THE MOST POPULAR
POOLS PREDICTION PROGRAM OF 1983
NOW EVEN BETTER VALUE IN 1984!!!!**

- ★ Supplied with a database tape containing data on over 8,000 matches since 1980.
- ★ Database is updated each week by user.
- ★ Match and Division names already in the program — no tedious typing every week!
- ★ Program is menu driven for simplicity of use.
- ★ Errors can easily be corrected — the program even checks your entries!
- ★ Comprehensive instruction manual designed to make the program easy to understand.
- ★ Will also forecast the least likely draws for those who prefer to bet on fixed odds.
- ★ Supplied together with SPECTASORT — the Perm Generation Program which takes SPECTADRAW 2's predictions and turns them into ten 8 from 10 full cover perms. Complete your coupon direct from the screen!!

SPECTADRAW 2, 8,000 MATCH DATABASE, SPECTASORT AND INSTRUCTION MANUAL. THE COMPLETE POOLS PREDICTION PACKAGE FOR THE 48K SPECTRUM — NOW AT THE UNBEATABLE PRICE OF £9.95 INCLUSIVE. (Cheques/POs payable to B. S. McAlley).

Write your own machine code adventures

Without any knowledge of machine code whatsoever

STOP PRESS!
Available soon for
the Commodore 64

THE QUILL

THE QUILL is a major new utility written in machine code which allows even the novice programmer to produce high-speed machine code adventures of superior quality to many available at the moment without any knowledge of machine code whatsoever.

Using a menu selection system you may create well over 200 locations, describe them and connect routes between them. You may then fill them with objects and problems of your choice. Having tested your adventure you may alter and experiment with any section with the greatest of ease. A part formed adventure may be saved to tape for later completion. When you have done so *THE QUILL* will allow you to produce a copy of your adventure which will run independently of the main *QUILL* editor, so that you may give copies away to your friends.

THE QUILL is provided with a detailed tutorial manual which covers every aspect of its use in writing adventures.

FOR THE 48K SPECTRUM AT £14.95

Now available in larger branches of W. H. Smith, Boots, John Menzies and from many computer shops nationwide, or direct from us by post or telephone.

Commodore 64

The other side of the tracks

Pete Gerrard continues his series on the Commodore disc drives

Last week we started exploring the basic (Basic?) principles involved when setting up a random access file on disc. Now, having outlined the procedures, we'll start creating such a file in earnest.

Writing a Record

First of all, we must open up a command route, using whatever disc drive device number is currently active: usually 8. We then have to specify a command channel, which can be any number from 2 to 14, since these are the routes used to transfer information to and from disc and 64, and channel 15 is the route for commands to the *Rom* in the disc and messages coming back from it. We also must specify a logical file number, which can be any number from 1 to 255, and which acts as a key to other details without you having to keep typing them in.

Normally people choose the same file number as channel number, so *Open* 15,8,15 would be the syntax we want, and records can now be got at using the *Print#* command.

The Data Route

Five routes, as well as the command route, can be open at the same time, and because of the time it takes to close a file (up to a few seconds, whilst the disc drive tidies everything up) it's as well to keep them all open whilst everything is going on, rather than opening and closing them all the time.

We also need to reserve a buffer to hold the information going to or coming from the disc drive, and the syntax here is *Open* file number, 8, channel, "#", where the # reserves the next available buffer, and associates it with that channel. Thus if we opened channel 2 we'd use:

```
Open 2,8,2,"#"
```

Copying the Data

This is done using the *Print#* command, and sending data down whatever channel we've opened into the correct buffer. Thus if our first record was:

```
GORE.....BRENDON...  
01 437 4343.....
```

and the part to go to the buffer, as the keyword need not be part of the direct access record, was stored in the variable *AS* thus:

```
AS="BRENDON...01 437 4343"
```

it could be transferred to the buffer by *Print#1,AS*. However, before we can do this we need to set the block pointer to a free block, and this is done using the Block Point command, or B-P. The syntax for this would be:

```
Print#15,"B-P";C;P
```

where C is the data channel number and P is the pointer position required. So our full command would be:

```
Print#15,"B-P";2;1
```

```
Print#2,AS
```

Finding a Free Block

A simple way of finding free blocks is to put the direct access files onto an otherwise empty diskette. Then, as long as you don't use track 18 sectors 0 to 2, which are reserved for the disc directory, you control completely the placing of information on the disc.

However, if there are going to be other things there, we must find out which blocks are free and reserve them for our own use. This is done using the Block Allocate command. When you use this command to tell the disc that a particular block is to be allocated, and read the error channel, one of two messages will occur.

Either you'll be told OK, and the block will be allocated, or you'll get error message number 65, *Bad Block*, followed by two numbers, which are the track and sector of the next free block down the disc.

So, if you always attempt to allocate track 1, sector 0, the first time you'll be okay, and ever after you'll be told *Bad Block*, and the location of the next free track and sector. Then, if we allocate that, it will be reserved for our use and the disc drive won't use it when storing programs or sequential files. So, the complete syntax would look like this:

```
Print#15,"B-A";0;1;0 which attempts to  
allocate drive 0, track 1, sector 0.
```

```
Input#15,EN,EM$,ET,ES which reads the  
error message from the error channel. If  
EN=65, EM$ will equal Bad Block, and we  
can then:
```

```
Print#15,"B-A";0;ET;ES which allocates  
drive 0, track ET and sector ES: the next  
free block.
```

To transfer the buffer to the disc, another disc command, Block Write, must be used, specifying the command channel, the drive number, the track and the sector, which we already know to be ET and ES. So, we must:

```
Print#15,"B-W";2;0;ET;ES assuming  
we're using command channel 2, of course.
```

Keeping Track of the Index

The index associates the keyword with the track and sector number of the information you put on the disc, and the ideal way to handle all this would be in an array, holding the surname, and the associated track and sector. Thus our entries might look like this:

```
GORE 1 2  
LAKE 1 1  
KELLY 1 0
```

The track and sector can then be read off using the *Val* and *Str\$* commands to go from string data to numeric data and back again.

As the index grows, searching through it becomes a tedious process, so it would be a wise idea to keep it all in alphabetical order, and then use a binary search to get to the specified item quickly.

This involves guessing at the middle location in the array, and then (if there were 100 elements in it) guessing at 75 if your guess is too low, or 25 if it's too high: do you see why it should be alphabetical now? So that the computer can alphabetically compare the name it finds there with the name that it's after, and branch accordingly.

Thus, when we do track the name down we can get the track and sector numbers and read the data back again, using the *U1* command, which requires the channel number, drive number, the track and the sector.

This command transfers the contents of a specified track and sector into the associated channel buffer, and a simple *Input#* down that channel will transfer the information into Basic. Like this (assuming channel 2):

```
Print#15,"U1";2;0;T;S which will transfer  
the information from track T sector S into  
the buffer associated with channel 2.
```

```
Input#2,AS which will put the contents of  
the buffer into the variable AS.
```

A couple of things to watch for. Try to keep your records less than 80 characters long, as Basic *Input#* can normally only handle 80 character chunks at a time. Any more than that and the machine usually hangs up!

Don't put blank strings as part of the disc information, convert them into shifted spaces or something. Validating discs will cause all kinds of chaos, and if you have done that you'll have to re-create everything from your key index array. As you can see, relative records are not the easiest things in the world to write, but at least the last two weeks should have pointed you in the right direction!

MOGUL

THE HOTWARE PEOPLE

FIRE ANT

Written by Mike Wacker

AVAILABLE FOR COMMODORE 64

As the last remaining soldier of an army of ants crushed by a group of scorpions, your sole purpose in life is to rescue the Queen Ant taken hostage only moments ago. Fast action machine code game that calls for a winning combination of sharp wits plus extra fast reflexes.

Why do so many Spectrum users run 16/48 every month?

Is it the games? The editorial?
The reviews? The machine code
routines? The competitions? The
adventure help page? The educational
programs? The Long Way Home?
(Not the trip back from the newsagent,
but our serialised adventure with state
of the art, instant graphics in 48K.)

We're not sure, but you can find out for
only £2.99 at branches of W H Smith,
John Menzies and leading newsagents.

!!NEW!! GRID BOMB

**EXCITING ARCADE
GAME YOU'LL WANT**
A race against time!
You must reach the Timebombs before
they count down to ZERO.
You need to defuse them before they
EXPLODE!

You want to earn points by eating up the
stepping stones and as many flags as
you DARE!

Beware of SKULLS and the menacing
BOVVER BOOTS which don't make life
any easier.

Features
100% Machine Code
Joystick or Keyboard
Melody Play Volume Control
High Score Game Hold
8 screens + bonus interlude
Full use of colour and sound.

Open Forum

Open Forum is for you to publish your programs and ideas. Take care that the listings you send in are all bug-free. Your documentation should start with a general description of the program and what it does and then give some detail of how the program is constructed. We will pay the *Program of the Week* double our new fee of £6 for each program published.

Reactimer

on Spectrum

Have you ever wondered how fast your reaction time was, but couldn't find an easy way to calculate it?

My program will work out your reaction time quickly and easily, all you have to do is to press a key.

It works it out by using the Spectrum's internal clock. It takes two readings from the internal clock, one at the start and one when a key is pressed. Then the reaction time of the computer operator is found by

taking away the 1st reading from the 2nd reading.

On average you will find it to be about 0.3 of a second. A good one is less than 0.2, my best is 0.22 of a second.

Fruit Machine

on ZX81

This programme is a simulation of an arcade fruit machine. When run, the screen

shows how much money you have, and asks if you want another go. On entering a Y the screen shows the reels, the winning combinations and some other information. Each time you have another go: 20p or £2 will be subtracted from your score. At

random intervals, a hold will be awarded and the reels can be held by typing the reel Nos. When you have held the ones you want, type Q and the game will automatically continue. This program will fit into 4K of memory.

HISOFT PASCAL DEVPAC

Quality ZX SPECTRUM* Software HISOFT PASCAL 4T

"... I haven't seen any other compiler that could match Hisoft's Pascal" ... Using the Spectrum Micro - Autumn 1983
"This is a very impressive product ... of benefit to any Spectrum programmer ..." David Bolton ZX COMPUTING Aug/Sept 1983

Just two comments from long length reviews of our powerful and virtually full implementation of Standard Pascal. The advantages of using Pascal are well-known — fast, self-documenting, and above all, structured programs and now, with Hisoft Pascal, you can reap all these benefits on a wide range of home computers, including the 48K Sinclair Spectrum! Hisoft Pascal produces programs that run typically 40 times faster than equivalent ZX BASIC programs and, sometimes, up to 1,000 times faster!

Hisoft Pascal supports FOR ... DO, WHILE ... DO, REPEAT ... UNTIL, CASE ... OF, INTEGERS, REALS, CHARACTERS, RECORDS, POINTERS, SETS, ARRAYS etc. etc. — it is not a Tiny Pascal but a virtually full implementation of the language allowing the user to develop true high-level language skills while attaining a execution speed close to that of machine code. Complete with a 70-page manual.

HISOFT DEVPAC 3

"... DEVPAC is most highly recommended. The documentation is first class." Your Computer May 1983

"... If you write programs in machine code, buy DEVPAC — it is the best currently on the market." Adam Derrington, ZX SOFT in Which Micro September 1983

Two comments from reviews of earlier versions of DEVPAC — now we have DEVPAC 3 available: a powerful Z80 assembler with conditional assembly, assembly from tape (to enable generation of very large code files), ORG, EQU, DEFB, DEFS, DEFW, DEFB, labels of any length — in fact all you need for fast (3,000 lines per minute) and powerful assembly programming. But it doesn't stop there: DEVPAC 3 also includes an incredible debugger/dis-assembler giving you a "front panel" display of the Z80 system and allowing extensive debugging of your machine-code program, including single-stepping programs EVEN IN ROM!! Open up the secrets of low-level programming with DEVPAC 3.

Prices:
Hisoft Pascal 4T (ZX SPECTRUM) £25 inclusive
(NewBrain, SHARP MZ700 etc) £35 plus VAT
Hisoft DEVPAC 3 (ZX SPECTRUM) £14 inclusive
(NewBrain £25 inclusive)

STOP PRESS Hisoft Pascal for the SPECTRUM now comes complete with a Turtle Graphics package allowing fast and easy production of complex graphic displays

Chemistry

on Oric

This program should work on any Oric. It is a Chemistry symbol tester. It asks what the symbol of an element is and you answer. I have used *Chrs* to turn off *Caps* and so the answer will have to be shifted on the first

letter — you get four chances.

Variables

CN	Number of tries
C\$	Name of Element
P\$	Symbol of Element
J	Number of elements and symbols
RN	Random choice
ANS	Answer
R	Checks element is not the same as one before.

Program notes

100-120	Rem Statements
130	Clear Screen and turn off Caps
140-170	Reads Data (Elements and symbols)
180-210	Choose Element
220-240	Print Element
250	Correct Answer
260-300	Try again
310	Leaves line
320	Wrong then tells answer
321	Different Element
350-650	Data

Science fiction?

This week brings news of a breakthrough in microchip technology that makes science fact seem even more like science fiction. Many radio amateurs will be familiar with certain transistors known as GaAsFETs. These transistors have been developed mainly because of radio's demands for components combining high gain with extremely low-noise characteristics. Radio enthusiasts like myself, who are interested in using the VHF

and UHF sectors of the radio spectrum combined worldwide communication have looked to GaAsFETs, with their ability to amplify the tiniest most distant signals, to extend out horizons.

The secret of GaAsFETs is the semiconductor Gallium Arsenide. This material is superior to silicon in that it allows the passage of electrons at about six times the speed that they can travel in conventional microchips. What all this means in simple terms is that if we could replace silicon in our current computer chips with Gallium Arsenide (GaAs) then our microprocessors and memory etc would operate that much faster. The big problem has been the seemingly insurmountable difficulty growing GaAs crystals that are sufficiently pure in significant quantities.

Well, the news is that the Toshiba Corporation of Japan have overcome the problems. At a recent International Solid State Conference in San Francisco, Toshiba presented a paper describing their new, large scale integration gate array based on the semiconductor Gallium Arsenide. They have produced chips with over 1050 basic gates or 5000 transistors on a piece of GaAs 3.75mm x 3.75mm. The propagation time is the world's fastest at 210 picoseconds — a record. Suffice for me to say that a picosecond is a millionth of a millionth of a second. The mind boggles.

As if this wasn't enough, Toshiba calmly went on to announce their 'reactive ion etching' system. One of the great problems with microchips of any sort is etching the tiny circuits involved. Toshiba's

new system incorporates something called a Platinum Buried Gate process and has halved the size of the already incredibly tiny transistors that make up these chips. They have reduced them from two millionths of a metre to one millionth of a metre.

These two achievements together lead to a speed and integration never before achieved. Next time you look at a transistor, think of Toshiba who have now made them invisible to the naked eye.

Ray Barry GW6 JJN

This series of articles is designed for radio and microcomputer enthusiasts alike. If you have any queries that you want answered, hints and tips to share, or topics that you would like to see covered, write to: Ray Barry, Microradio, Popular Computing Weekly, 12-13 Little Newport Street, London WC2R 3LD.

Tony Bridge's Adventure Corner

A moral tale

I know that you are all itching to get on with adventures, but this week I want to take some time out to tell you of a very strange experience I've just had — and no, it wasn't walking past a pub!

To set the scene: A software shop in London's West End on a rainy Wednesday afternoon.

Dramatis Personae:

Tony Bridge, an occasional scribbler, specialising in popular computer software.
Mr Smooth, a shop assistant.

Bridge enters the premises. Two reasons for this — the first and foremost, to escape the pouring rain. The second, to check out new adventures and other light relief.

Mr Smooth: Yes, sir?

Bridge: Er — pardon?

Mr Smooth: May I help you sir?

Bridge: No, thanks, just looking.

Suddenly, his eyes light up! What's this, in the Apple section? Not an adventure, but the fabled Sublogic Flight Simulator II, rumoured to be the best available for computers of less than two million dollars. This is a snip at — gulp! — £41.50. Still, hang the expense, the program is perfection personified.

Bridge (holding up the package and looking toward the cash desk): Excuse me, do you have this for the Atari?

Receiving a negative answer, Bridge replaces the box from where he plucked it.

Mr Smooth: (snarling): Put that back where you found it!

He snatches it from the hands of the astonished Bridge, and places it in a completely different position on the shelf. Bridge (aghast): But — but — I found it up here (attempts to put it back where he found it).

Mr Smooth: I said, put it back where you found it!

Bridge: But — er —

Mr Smooth: Leave it alone!

Collapse of Bridge, who exits into the rain of London's West End, leaving behind a shop assistant who can put another feather in his cap, labelled "Who do these customers think they are?"

This program was just about the most expensive non-business package in the shop and I was quite prepared to buy it. So why was I made to feel like a common thief?

What is it about us computer-users that invites such cavalier treatment? The shopkeepers and assistants are there to serve us, and they should look after the 14-year-old trying to decide which version of Galaxian to purchase with his hard-saved £5 as much as the businessman spending 15,000 tax-deductible pounds on an accounting package for his VAT.

While I'm on my soapbox, I've just noticed that, finally, an Atari program has reached the top three in the software charts. Atari games have never before reached such dizzy heights, even though any Atari game can wipe the floor with any of the opposition. Trouble is, of course, they're so darned expensive! It is, surely, no coincidence that the one I'm talking about, *Batty Builders*, from English Software, is priced at under £10. Take note, Atari — when are you going to price your software for the real world?

Back to the world of adventuring!

Thanks for your letter, Mrs M Roberts — to PCW's Editor, I know, but the sentiments you expressed are of great interest to this column and its readership.

Back in the second or third Corner I made some comments about an ill-advised adventure for the ZX81. This was *Love*, from Remsoft of Brighton. At the time

although I didn't much care for the program, I did wonder if I was being rather po-faced in complaining about it. The game relied on the player, who took on the persona of a poor, defenceless female, having to strip or undress to progress at certain points in the adventure. But more and more women have written to me over the intervening months, in support of my criticism, and now we have, in this magazine, writers like Jane Stoneham drawing our attention to the attitude of most software producers towards women. As she says, every one should try playing *Ant Attack*, from Quicksilva. Yes, it is a good game in itself, but it allows the player to take the role of either the male or the female protagonist, the female being cast in the traditional submissive mould, seeking help from the dominant male character. Any male player taking the female's part would gain a certain idea of just how annoying and patronising this traditional role can be to a woman.

It is for this reason that I didn't much care for Remsoft's *Love*, nor more recent programs, like *Gwendoline*, from the States.

It's noticeable that, while a majority of the letters from males mention their Hi-Score in an arcade game, I have not had one "Score Sheet" from a woman. It seems to me that women grow out of zap-games very quickly — although my own daughters certainly enjoy a quick game of *Frogger* or *Pole Position* on the family Atari, they are quite happy to immerse themselves in *Snowball* or *Knight's Quest*, and this is borne out by the letters I receive. Women certainly appear to have a tenacity when it comes to adventures, and they only write to me for help when they are absolutely desperate.

This series of articles is designed for novice and experienced Adventurers alike. Each week Tony Bridge will be looking at different Adventures and advising you on some of the problems and pitfalls you can expect to encounter. So, if you have an Adventure you want reviewed, or if you are stuck in an Adventure and cannot progress any further write to: Tony Bridge, Adventure Corner, Popular Computing Weekly, 12-13 Little Newport Street, London WC2R 3LD.

50 BOOKS TO BE WON!

Enter our competition by answering the questions below and win a copy of *A Guide to Playing The Hobbit*, by David Elkan published by Melbourne House. When you have answered the questions, fill in the coupon and send it together with next week's coupon to PCW, 12-13 Little Newport St., London WC2R 3LD by 10 May 1984. The first 50 correct entries will receive a copy of the book.

1. What is Durin's Day?
2. What is Thorin's last name?

3. Where does Elrond live?
4. What is Gollum's birthday present?
5. What is the answer to this riddle: 'A box without hinges, key or lid, Yet golden treasure inside is hid'
6. Where does Gandalf's cousin, Radagast live?
7. Why did Bilbo name his sword Sting?
8. What is the name of Thorin's father?
9. What is the necklace of Girion, Lord of Dale, made from?
10. What was laid on Thorin's tomb?

RULES

- 1) Each entry must consist of two coupons.
- 2) Answers must be on a separate sheet of paper.
- 3) No correspondence will be entered into.
- 4) All entries must be received by the closing date, May 10, 1984.

Peek & Poke

BROKEN CARTRIDGE

Melvyn Sturee of Gorleston, Great Yarmouth, writes:

Q I have a TRS 80 colour computer which I think is great, but not many people over here seem to know the machine. Are you going to publish any material for it? Also can cartridges be broken if connected when the computer is switched on? I did this with an old *Dino Wars* cartridge and now it does not work.

A We would probably publish some material if we were sent it. The TRS 80 is like the Dragon in that it uses not only the 6809 but also passes control straight to the cartridge. Indeed I recently dealt with this problem on the Dragon. It is very likely that your action has caused damage to the cartridge, because when anything is switched on there are short, but potentially lethal, (to the ICs) power surges.

IS IT SAFE TO USE?

Eric Good of Cherwell Avenue, Woodstock, Oxford, writes:

Q I am thinking of buying a Dragon home computer (64) but I would like to know if it is safe to use it on an old black and white (625) line television. Another question about televisions comes from Paul Hendry of Boundry Park Road, Manchester who writes: Is sitting in front of a television that I use for my computer dangerous? A friend of mine at school said that a television when used with

a computer gives out small amounts of radiation that can be bad if used for too long?

A Any 625 line television should work with your home computer, and no damage is done whether it is black or white, or colour. Indeed problems are more likely to arise with colour televisions as they need far more control and balancing in terms of display. There are plenty of Spectrum owners who can testify to this.

As for the second question, minute amounts of X-rays are emitted through the front of cathode ray tubes, which are, after all, beams of fast moving electrons. Evidence of this is still hazy and based mainly on older types of VDUs, which have now been improved. If you sat within a few inches of your television screen, for several hours a day for several years then you might start to do yourself harm. Whether the TV is used for computing or not is irrelevant.

PONDEROUS BASIC

N.G. Harvey of Robina Drive, Cheadle, Stoke-on Trent, Staffordshire, writes:

Q After several months of frustration with a 1K ZX81 I obtained a Commodore 64. I am delighted with this machine but a little disappointed with the ponderous Basic.

Is there any way that I can access the Ram of the 64 to the Z80 chip in my ZX81, ie, can I interface the two computers with a standard or made-up interface, or will I have to pay someone to delve into the innards of my ZX81. Also, if the above is possible, would I lose the superior sound, graphics, sprites, and so forth?

A There are a few unclear points in what you say. Where you say Ram I think you mean Rom.

A point that needs to be made is the difference between the Cpu and the Rom. (In fact Rom itself is only a particular type of storage but is taken to mean the language and the operating system, which is how I shall use it here.)

A 6502 is a 6502, regardless of whether it is used in an

Apple, Commodore, BBC or whatever. The same is true of the Z80. What is different from computer to computer is the Rom that uses the CPU. In the same way that three identical cars, in the hands of three different drivers will soon handle differently. In computer systems most of each computer's uniqueness comes from the Rom. The Rom of the CBM 64 is in 6502 machine code, this would have to be translated into Z80 machine code if it was to be usable on the ZX81. Unfortunately you are trying to merge the excellent Sinclair Basic with the good bits of the CBM 64. Thus a straightforward translation is not sufficient. (Neither is it easy). A single instruction to the CPU which you might want translated to Z80 in one context, might need to remain the same in another. At the most fundamental level you are trying to merge two Roms used by two different Central Processing Units.

ASSEMBLY LANGUAGE

Oliver Cobb of Hadlow Down Road, Crobrough, Sussex writes:

Q For Christmas I received the *Picturesque Editor/Assembler*. Unfortunately I do not know any thing about assembly language. I have looked for a book on the subject, but I have not found one. Could you tell me if there is one and if so what, and what is the price?

A The *Editor/Assembler* is only a way of making machine code easier to use. There are two books that might help you if you want to start learning machine code. Melbourne House do a book called *Spectrum Machine Code For The Absolute Beginner* by William Tang. Or there is *Spectrum Machine Code Made Easy*, volumes one and two, by

James Walsh, and Paul Holmes, published by Interface. Either would be a good way to start to learn machine code.

CRYPTIC MANUAL

J.E. Price of Woodlands Close, St Albans, Herts writes:

Q The Sinclair manual is fairly cryptic about the possibilities of adding Strings together, and almost nothing on about the use of *Screens* command, to examine what character is displayed at a given screen location. Nevertheless it seems logical that the following program should produce the results: abc abc abc

Can you explain why it does not?

10 CLS: PRINT "abc"

20 LET m\$ = ""

30 FOR x=0 TO 2 STEP 1

40 LET m\$=m\$+SCREEN\$(0,x)

50 NEXT x

60 PRINT m\$

A You do not need to look any further than your program, as this contains the answer in line 40. *Screens* like *Strs* is a read only command. There is no place in the Spectrum's memory map, that is reserved and labelled *Screens*. It cannot be stored and cannot be operated on. Because of the way the Rom is written, any attempt to operate on it will result in the String holding the value twice.

Further, any new values will always overwrite any existing values. There are probably some interesting quirks somewhere within the *Screens* command, but this does not help you. What you need to do is assign a second variable the value of *Screens* and then carry out any new operations with this. So your line 40 will be something like:

40 Let n\$=Screens(0,x): Let m\$=m\$+n\$

Is there anything about your computer you don't understand, and which everyone else seems to take for granted? Whatever your problem *Peek* it to Ian Beardsmore and every week he will *Poke* back as many answers as he can. The address is *Peek & Poke*, PCW, 12-13 Little Newport Street, London WC2R 3LD.

The best books for the BBC Computer

functional forth
for the BBC computer

Functional Forth

Boris Allan develops routines in Acorn soft Forth to demonstrate a) how easy it is to write in Forth and b) that the programs are fast enough to dispense with the need for machine code.

ISBN: 0 946408 04 1

Programming for Education

The book, written by teachers, is aimed at showing younger children how the various features of the BBC Computer can be used to their best advantage. ISBN: 0 946408 10 6

graphic art
for the BBC computer

Graphic Art

The graphics in this book match the style and sophistication of the BBC computer and its Basic language. Boris Allan shows what can be achieved with Turtle graphics.

ISBN: 946408 08 4

DIY Robots and Sensors

Make your own joystick, robot, eye or whatever you like. The book gives you step-by-step instructions on how to construct a wealth of gadgetry for use with your BBC computer (Pub. 28th October). ISBN: 946408 13 0

THE EASEL. A superb graphics program for the 48K Spectrum. Featuring a powerful graphics tablet, combining a facility to animate up to four screens at m/code speed, creating a stunning cartoon effect. Supplied with instructions for £5. Cheques to M. Simpson, 116 Ashton Lane, Sale, Cheshire.
SOFTSAVE DISC for Vic 20 to transfer your cassette software on to floppy disc. Cassette with instructions £5.95 from: Softsave, 65 Stonewood, Bean, Dartford, Kent.

MANIC DESIGNER. Bored with existing twenty levels? Then re-design them with this program. The original and best. "Excellent." N. J. Shelley. For 48K Spectrum. Send £4.50 (cheque/PO) to P & M Software, 16 Bridge Road, Park Gate, SO3 7AE.

ADVENTURE — 48K ORIC. Lair of Mairdred the Mighty. Difficult, devious, deadly. Only £6 from David Software, 29 Coopers Close, Stetchworth, Newmarket, Suffolk.

Make a **QUANTUM LEAP** today...
Our 85 characters by 24 line screen can transform your SPECTRUM displays now!

"MICRO-PRINT 85"

is an outstanding utility that lets you select from a choice of SIX character pitches in your screen and ZX printing. Either:
85 characters-per-line,
or 64 characters-per-line,
or 51 characters-per-line,
or 42 characters-per-line,
or 36 characters-per-line,
or 32 characters-per-line...
Any pitch, any time, any place. Mix all six within any line. We even give you a COPY command for any 1-24 line group. "Micro-print" is incredibly versatile — nothing else comes close! The 16 & 48K cassette & Demo are £5 (£6 export) from

MYRMIDON SOFTWARE
PO Box 2, Tadworth, Surrey
KT20 7LU.

(STOP SECRETS)
Be in FULL CONTROL of programs on YOUR COMPUTER. STOP and reveal the SECRETS of your favourite programs. A machine code UTILITY that STOPS, modifies BASIC or Machine Code programs, protected or not, WITHOUT CRASHES. Activate routine, press two keys and be in FULL CONTROL. LEARNLIST, MODIFY etc., all the options are yours. The ideal MICRODRIVE companion. 'Tell me more about your mother..'

Artificial Intelligence on the
Commodore 64

by Keith and Steven Brain

Artificial Intelligence on the Commodore 64 shows you how to implement AI routines on your home micro and turn it into an intelligent machine which can hold a conversation with you, give you rational advice, learn from you (and teach you) and even write programs for you.

The book explains AI from first principles and assumes no previous knowledge of the subject. All the important aspects of AI are covered and are fully illustrated with example programs.

For many years science fiction books and films have contained 'intelligent' computers which appear to be at least the equal of man. Although some of the features described in these remain illusions, extensive research into AI has brought many of the ideas much nearer reality.

Look out for the Sunshine range in W.H. Smith's, Boots, John Menzies, other leading retail chains and all good bookshops. Dealer enquiries: 01-437 4343

Please send me ☐ Intelligence on the Commodore 64 at £6.95 each. I enclose cheque/postal order for £..... made payable to: Sunshine Books, 12-13 Little Newport Street, London WC2R 3LD. Or phone your order through an Access Mastercard 01-437-4343

PEAKSOFT CRICKET

Tim Love's

"I've just been reading your advert. It says Tim Love's Cricket is the most realistic cricket game yet produced for any home micro."

"That's right."

"Well, you've got to say that, haven't you? I'm surprised you didn't say it swept the floor and made the tea as well. It says it's under total joystick control."

"Right again."

"Are you saying I can use a joystick to make the bowler deliver an off-break pitched two feet to the bowler's left, six feet from the crease...?"

"With practice, certainly."

"...hang on, I haven't finished yet. And to fool the batsman, can I make it a quicker or slower ball than usual?"

"Finished?"

"Yes...no - can I also, using the joystick, control where the bowler releases the ball and the direction in which he bowls it?"

"Finished now?"

"Yes."

"The answer's still yes - and you'll see it happen in full-bodied, animated graphics."

"What about the fielders - can I position them myself?"

"Of course."

"With the joystick?"

"Naturally."

"Well, just how realistic is it? For example, what happens if the batsman gets an edge?"

"If it's a Denis Lillee special, he might be lucky and fluke a boundary. On the other hand, he might be caught in the slips."

"You do, of course, control the batsman with the joystick."

"Of course."

"Come on - there must be a limit."

"Ask away."

"All right - can I pick my own teams, decide how skilful each batsman and bowler is, can I practise bowling, be out LBW, run out or bowled, can I hit my wicket or be caught, are there byes, no-balls and wides, does a damp wicket help the spinners, if I need a break, can I save the game...?"

"Hang on, let's catch up. Yes, yes, yes, yes, yes, yes, yes, yes, yes, yes, yes, yes, yes, yes, yes."

"And what happens if I've no-one to play against?"

"Your Dragon will give you a game - at any of three skill levels."

"Dragon? Dragon? I've got a Spectrum. What are you going to do about that?"

"Sell you a copy of Space Invaders."

TIM LOVE'S CRICKET. ONLY FOR THE DRAGON 32. £8.95

LIBERAL?

More DK'Tronics software in droids and drabs but *ZigZag* is one of its most impressive releases for ages.

The game is a very sophisticated version of all those 3D maze games where you grope your way through endless passages looking for things and running away from baddies.

ZigZag is true to this form but cleverly done with sprites and perspectives and all the

other techniques now mandatory on any self-respecting Spectrum game.

Aim of the game is to patrol various sectors hunting down the Scarabaqs — funny little creatures looking like they've stepped out of *Yellow Submarine*. Using the layout of the maze intelligently these must be cornered and interrotated — a blast of the old plasma soon loosens their furry little tongues. Once a Scarabaq cracks you get the digit of a code which, once completed, will allow you to reach the next level.

As a sop to liberal consciences you are given the option of whether to blast the little beast into a thousand particles or let him free to scurry away another day — worryingly, the temptation to blast is strong.

It's not all one sided, of course, there are some much nastier nasties that will sap your energy — needed for movement and blasting.

FAMILY TREE

Genealogy is a subject that involves months of painstaking work, not only trying to prove your family are of royal blood, but also actually constructing the vast chart of all your discoveries.

In the latter area the computer can now help. *Genealogy* from Bel Tech is an elaborate database/cataloging system that enables you to input the details of your family tree and see them displayed in the classic form, ie, with branches and lines indicating the various links between all the different parts of your family.

Using a range of menu options you can 'interrogate' the database to explore particular areas of interest, like marriages in the female line, etc. You can print out the results to impress your friends.

LOADED

The Duckworth *Editor/Assembler* is a utility program designed to facilitate machine code programming on the Commodore 64.

In the past, these packages have been expensive — partly because they are usually derived from the very different, and more expensive market for the Pet — Commodore's business machine. However, there are now a couple of packages available for under £20 which have all the main features of the more expensive packages.

Briefly, the *Editor/Assembler* enables you to write your machine code in the slightly

easier to understand language of assembly — mnemonics describing what's been loaded in which register, etc.

The booklet with the program is brief and not I think suitable for the beginner. Machine code programmers should find it useful though.

SELECTIVE

Penguin's new range of study software is designed to provide basic text revision of Shakespeare's plays. At the moment, programs are available for *Henry IV Part 1*, *Julius Caesar*, *Macbeth*, *Merchant of Venice*, *Romeo and Juliet*, and *Twelfth Night*.

What the programs do is enable you to search the text of the play for particular references to a given person or theme.

In a way, it works rather like

a conventional database — you tell it to 'search' the text for, say, text references featuring *Lady Macbeth* and *Blood* and it produces all the examples it can find. More than that, it refers you to other interlocking themes and explains each reference.

For people taking 'O' levels these programs could be genuinely useful — something I've not been able to say about many other pieces of educational software I've seen.

Obviously, the program does not look through the text, it would be impossible to fit it into 48K; rather it has a selective and carefully prepared store of references and correspondences created by a particular person (or group of people). Thus you can't investigate say, *Lady Macbeth* and sexual repression, because it isn't one of the given topics. Treat it with some suspicion then.

Program *Macbeth*

Before *Millionaire* from Incentive software no-one had exploited the one obvious subject for a simulation/strategy game — running a software house.

Millionaire is about just that and, more to the point, does it with some style and professionalism. Like most simulations the idea is to make money by taking the right decisions for your business. Unlike many simulations, however, you really will have to consider carefully what to do, how much to spend, etc.

Aside from being very complex, the game has many other good points — an automatically rescaling graph is drawn to show you how sales are going, the character sets have been redesigned to add variety and interest.

PROFIT-MAKING

As a point of interest (or rather lack of it) I went bankrupt after two years of profits — more than can be said for a good many real software houses.

New Releases

BIZARRE

Pigs In Space used to be the dramatic cry that preceded one of the funnier sketches in the *Muppet Show* before it went cute. It is also the title of a fairly bizarre new game from Ace.

It seems these intergalactic space wolves are dropping threateningly out of their intergalactic wolf spaceship. Their objective, we can know in advance, is not friendly. You have to prevent the wolves from reaching the ground by shooting at them from a basket which is raised and lowered by some pigs.

The wolves can defend themselves from this attack, by throwing rocks at you and running towards your basket. The game is totally ludicrous and even addictive in a strange sort of way. No programming marvels here though.

SQUARED GRID

Timebomb is the latest arcade game from CDS Microsystems whose recent releases have been language programs.

The game is one that has been seen before in various guises including quite a good version printed in this magazine. It involves moving a boot

across a grid of squares to get to a bomb before it explodes.

As a square is touched it can no longer be used so the game becomes consequently more and more difficult. Grid lines can be moved left or right in an attempt to form usable paths to each new bomb. It is definitely a game of skill and tactics rather than a test of reflexes, despite the urgency provided by a clock ticking away the seconds before you are blasted to Kingdom Come.

Not a difficult game to program but good fun nevertheless.

SPLIT SCREEN

Phipps Associates have released a new program—it's an adventure (cheers, whistles, sighs of relief etc) and it looks great.

Colditz is a graphic adventure in the reliable tradition of *Knight's Quest* and *Pharaoh's Tomb*—it has pleasing split screen colour pictures and a large number of locations.

Phipps have thoughtfully provided me (knowing, probably, how hopeless I am with adventures) with a map annotated with what objects are required where as well as what actions must be performed.

This reveals the adventure to be very complicated but totally fair—more or less the ideal state. The plot involves escaping from Colditz and then blowing up a bridge—you will find it very, very difficult indeed.

GHOULISH

More from Virgin, this time it's a text adventure for the Spectrum. *Atlas Assignment* has you in search of the American nuclear defence plans stolen by a man called Atlas—this cartographical reference is, as you will discover, not irrelevant to playing the game.

There is superficially nothing really new here—standard two word entry etc. In fact though, a quick play suggested the game was imaginative—many of the locations have shadowy figures lurking in them—an amiable drunk or a baddie? There is also a micro Jet that isn't too difficult to find but where do you tell it to go? Such mysterious questions abound and I got quite hooked. Well worth a play.

LOW LEVEL

Most independent witnesses would agree that *Digital Integration's Flight Pilot* is the best flight simulation program for the Spectrum, beating even Psion's highly regarded offering into second place.

Night Gunner is the companies most recent release and despite the cassette cover and title is really a different sort of game entirely—for one thing you don't need any (well, not much) piloting skill at all.

The game involves fighting and bombing your way through 30 missions before being rewarded with the ultimate challenge of bombing the enemy base. Within each mission there are a number of elements requiring different sorts of skill—low level attacks where the danger of crashing is great, defending the plane against

fighters, blitzing tanks, etc.

The graphics and more surprisingly, the sound effects, are superb (it's almost worth

crashing just to hear them) the 3D is very well done and *Ultimate* would be happy to put this one out. Who are Digital Integration anyway?

PERSPECTIVE

Designs from your Mind is another one of those horrendously expensive but excellent books from America. It is about using the graphics on Atari machines to the fullest extent, and concerns itself as much with design and perspective techniques and with actual programming.

In many ways the book reads like a good school textbook should, with clear examples, recapitulations of new information, and plenty of pictures and diagrams.

This approach, of taking the 'art' part of computer graphics as seriously as if the TV screen was a piece of paper, proves very illuminating.

RESTRICTED

Goldstar Software whose programs we have mentioned in Popular has, as another string to its bow, a book division called Dorling Kindersley.

The first products are a series of step by step books on programming for all the main micros.

The books are excellent, at least in terms of the way they use lots of colour and screen displays to clearly explain exactly what to do. As a series they could form the best "basic introduction" to programming I've seen. But there's the rub — each section is so clear because it restricts itself to a limited area — if you want to cover the whole area it'll cost you a lot.

This Week is a new section that covers all the new software coming on to the home micro market each week. All suppliers should send details of their new programs to: This Week, Popular Computing Weekly, 12-13 Little Newport Street, London WC2R 3LD.

Is it education

I used to think... actually, I never used to think about educational software, having loftier matters to consider, such as how long to opening time. Pressed for an opinion, I'd have expected the stuff to be worthy and dull, selected by that rigorous screening which during O-level Eng Lit kept my pure young mind from the pollution of living authors.

Then the *Sunday Express* dreamt up their feature on educational software. Being involved with this book *Micromania*, I landed on the panel of alleged experts. It was hell: trapped all day in the Café Royal with a litter of Spectrums and BBC Micros (some even working) and endless schoolkids reducing everything to rubble in the name of Software Evaluation. Peering over their shoulders, I gazed upon the awesome vistas of state-of-the-art educational software. Worthy and carefully screened? Believe me, games like *Frogger* or *PacMan* are not only more exciting but — with their training in how to cross roads and dodge the fuzz — a lot more educational.

What should teaching programs do? Hold a kid's attention, I suppose, and painlessly teach something. Also the something should be worthwhile: too many of that day's programs chiefly taught you how to "play" the program itself, without relation to the real world. Thus *Amazing Ollie* ("Learning about numbers") and a set called *First Steps with the Mr Men* educate almost exclusively in how to move cursors round the screen. Computing for the sake of computing.

Again, familiar complaint, educational software isn't up to the pictures on the boxes. The thrilling space-war imagery of *Hot Dog Spotter* fades on sight of the actual display, dullish graphics featuring the occasional fall of a blob with dots on. You count the dots and hit the

relevant key, thus being educated in number recognition (fair enough), finding the Spectrum's number keys, bashing them hard enough to have any effect, and slumping across the keyboard in catatonia after about three minutes.

The programs lack imagination. *Timeman* is aimed at the doubtless vast number of kids who can't read clocks but are fluent with numbers and know without being told that you hit *Return* after each number. *Children from Space* uses the exciting idea of space visitors who, unexcitingly, need their English corrected. If your "corrected" sentence is wrong you type the whole thing again — no cursors here!

Symmetry is a pattern-drawing program which might teach a little geometry. The initial display explains how to draw lines by hitting 1 to go north, 2 to go northeast, 3 to go east, etc. You're then advised to write all this down, since you won't be told again. The prosecution rests...

Words Words Words was my favourite: as a professional writer I like to see potential rivals discouraged in early life. The challenge is to spot what the graphics are supposed to be: so when something appeared which looked like a large vole or small megatherium, our nine-year-old playtester scored for answering "dog". Next, the castle scene: a recognisable portcullis! "Portcullis," she typed. Not on your nelly, said the program. No such word. Only "gate" would do.

Educational software seems uneasily aware of its tediousness. Biggest hit with the kids was *Facemaker*, which despite promotional guff about "teaching children how to draw" was blatantly not educational: just another exercise in computerised funny faces. *Time Traveller* tries to teach history in multiple choice quizzes ("The Bronze Age was famous for: structural linguistics, votes for women, punk rock, bronze?"): the kids skipped through these to play the dodge-the-nasties arcade games thrown in to make history interesting. Thus the lasting educational impression was that Ancient Brits spent their days being chased by wolves through forests; Tudor folk by dagger-wielding courtiers through palaces; Victorians by rats through sewers.

So is educational software educational? Not very. It's great virtue, novelty, wears off too quickly — kids are blasé about computers even if we addicts aren't. Looking at today's great spurge of trendy "educational" cassettes, I can't help remembering the trendy skateboard rinks so many councils were building a few years back — or the language laboratory at my old school, abandoned when the novelty faded and the 0-level results dropped through the floor.

David Langford

Reverse digits

Puzzle No 103

When Cyndy became a 'young executive' she decided that the one essential item to complete the image was a new briefcase.

You know the sort of thing — real leather case, hand stitching, gold plated fittings, gold leaf initials and a personally selectable combination lock.

It was the lock that caused the problem as she could never remember the combination. Not, that is until she hit upon the following idea. You see, there were two fastenings each with its own independently settable four-digit code. She has

now set the locks so that the combination of both have the same digits but one has its digits in reverse order.

In case you are wondering how this helps Cyndy, she just has to remember that one number is just twelve times the other.

There you go! It's just a simple step to work out what the two code numbers are if she should ever forget. Or is it?

Solution to Puzzle No 98

In the program all the possible amounts are checked against the known facts. Note that the original number of pounds must have been greater than the number of pennies.

```
10 FOR L = 2 TO 99
20 FOR P = 1 TO L
30 LET A = L * 100 + P
40 LET B = P * 100 + L
50 IF (A-B) - 50 = A/2 THEN PRINT "ORIGINAL SUM = "A
60 NEXT P
70 NEXT L
```

Running the program shows that Tom originally had £86.32 and he lost £32.66. A further loss of 50p left him with a balance of £33.16 — half of the original amount.

Winner of Puzzle No 98

The winner is: M Docherty, Grand Avenue, London N10, who receives £10.
